00. FUNCTIONS & SETS

sets

$$A = \{x \mid \textit{properties of} x\}$$

- $A \subseteq B$: A is a subset of B
- $A \nsubseteq B$: A is not a subset of B
- $A = B \leftrightarrow A \subseteq B \wedge B \subseteq A$

operations on sets

- union: $A \cup B = \{x \mid x \in A \vee x \in B\}$
- intersection: $A \cap B = \{x \mid x \in A \wedge x \in B\}$
- difference: $A \backslash B = \{x \mid x \in A \wedge x \notin B\}$

notations of sets

- $\mathbb{R}, \mathbb{Q}, \mathbb{Z}, \mathbb{N}$
- $\mathbb{N} = \mathbb{Z}^+$
- $\emptyset$: empty set

notations of intervals

- closed interval (inclusive): $[a, b] = \{x \mid a \le x \le b\}$
- open interval (exclusive): $(a, b) = \{x \mid a < x < b\}$
  - $(a, \infty) = \{x \mid a < x\}$

functions

- **existence**: $\forall a \in A, f(a) \in B$
- **uniqueness**: $\forall a \in A$ has only one image in B.
- for $f : A \to B$
  - domain: A
  - codomain: B
  - range: $\{f(x) \mid x \in A\}$
- for this mod:
  - $A, B \subseteq \mathbb{R}$
  - if A is not stated, the domain of f is the largest possible set for which f is defined
  - if B is not stated, $B = \mathbb{R}$

graphs of functions

The graph of f is the set
$$G(f) := \{(x, f(x)) \mid x \in A\}$$

- if $A, B \subseteq R$ then $G(f) \subseteq A \times B \subseteq \mathbb{R} \times \mathbb{R}$
- each element is a point on the Cartesian plane $\mathbb{R}^2$

algebra of functions

function	domain
$(f+g)(x) := f(x) + g(x)$	$A \cap B$
$(f-g)(x) := f(x) - g(x)$	$A \cap B$
$(fg)(x) := f(x)g(x)$	$A \cap B$
$(f/g)(x) := f(x)/g(x)$	$\{x \in A \cap B \mid g(x) \neq 0\}$

types of functions

- **rational function**: $R(x) = \frac{P(x)}{Q(x)}$, where P, Q are polynomials and $Q(x) \neq 0$
  - every polynomial is a rational function ($Q(x) = 1$)
- **algebraic function**: constructed from polynomials using algebraic operations
- a function f is **increasing** on a set I if $x_q < x_2 \Rightarrow f(x_1) < f(x_2)$ for any $x_1, x_2 \in I$.
- a function f is **decreasing** on a set I if $x_q < x_2 \Rightarrow f(x_1) > f(x_2)$ for any $x_1, x_2 \in I$.
- even/odd:
  - **even function**: $\forall x, f(-x) = f(x)$
    - symmetric about the y-axis
  - **odd function**: $\forall x, f(-x) = -f(x)$
    - symmetric about the origin O
  - any function defined on $\mathbb{R}$ can be decomposed *uniquely* into the sum of an even function and an odd function
- **power function**: x^n
  - x^n is $\begin{cases} \text{an odd function,} & \text{if } n \text{ is odd} \\ \text{an even function,} & \text{if } n \text{ is even} \end{cases}$

01. LIMITS

definition

if $f(x)$ is arbitrarily close to L by taking x to be sufficiently close (but not equal to) a, then we write
$$\lim_{x \to a} f(x) = L$$
or $x \to a \Rightarrow f(x) \to L$

- the limit $\lim_{x \to a} f(x)$
  - depends only on the values of $f(x)$ for x near a
  - is independent to the value of $f(x)$ at a.

limit laws

- Let $c \in \mathbb{R}$. $\lim_{x \to a} c = c$
- $\lim_{x \to a} x = a$

Suppose $\lim_{x \to a} f(x) = L$ and $\lim_{x \to a} g(x) = M$. Let c be a constant.

- $\lim_{x \to a} (cf(x)) = cL = c \lim_{x \to a} f(x)$
- $\lim_{x \to a} (f(x) + g(x)) = L + M = \lim_{x \to a} f(x) + \lim_{x \to a} g(x)$
- $\lim_{x \to a} (f(x) - g(x)) = \lim_{x \to a} f(x) - \lim_{x \to a} g(x)$
- $\lim_{x \to a} (f(x)g(x)) \lim_{x \to a} f(x) \lim_{x \to a} g(x)$
- $\lim_{x \to a} \frac{f(x)}{g(x)} = \frac{\lim_{x \to a} f(x)}{\lim_{x \to a} g(x)}$ provided that $\lim_{x \to a} g(x) \neq 0$
- $\lim_{x \to a} (f(x))^n = \left(\lim_{x \to a} f(x)\right)^n$
- $\lim_{x \to a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \to a} f(x)}$

$$\boxed{\text{if } \lim_{x \to a} \frac{f(x)}{g(x)} \text{ exists and } \lim_{x \to a} g(x) = 0, \text{ then } \lim_{x \to a} f(x) = 0}$$

inequalities on limits

Suppose $\lim_{x \to a} f(x) = L$ and $\lim_{x \to a} g(x) = M$.

lemma
if $f(x) \le g(x)$ for all x near a (except possibly at a), then $L \le M$.

lemma
If $f(x) \ge 0$ for all x, then $L \ge 0$.

direct substitution property

Let f be a polynomial or rational function.
If a is in the domain of f, then
$$\lim_{x \to a} f(x) = f(a)$$
If $f(x) = g(x)$ for all x near a except possibly at a, then
$$\lim_{x \to a} f(x) = \lim_{x \to a} g(x)$$

applications

- if a is not in the domain (e.g. 0 denominator), don't apply directly
- convert to an equivalent function and then sub in

one-sided limits

- limit laws also hold for one-sided limits

If as x is close to a from the right, $f(x)$ is close to L, the right-hand limit of f as x approaches a equals L.
$$(x \to a^+ \Rightarrow f(x) \to L) \Rightarrow \lim_{x \to a^+} f(x) = L$$
If as x is close to a from the left, $f(x)$ is close to L, the left-hand limit of f as x approaches a equals L.
$$(x \to a^- \Rightarrow f(x) \to L) \Rightarrow \lim_{x \to a^-} f(x) = L$$

$$\boxed{\lim_{x \to a} f(x) = L \leftrightarrow \lim_{x \to a^+} f(x) = \lim_{x \to a^-} f(x) = L}$$

$$f(x) \to L \Leftarrow x \to a \Leftrightarrow \begin{cases} x \to a^+ \Rightarrow f(x) \to L \\ x \to a^- \Rightarrow f(x) \to L \end{cases}$$

infinite limits

Suppose f is defined on both sides of a (except possibly at a).
If $f(x)$ is arbitrarily large by taking x sufficiently close to a,
$$\lim_{x \to a} f(x) = \infty$$
If $f(x)$ is arbitrarily negatively large $\cdots$,
$$\lim_{x \to a} f(x) = -\infty$$
Suppose f is defined on $[M, \infty)$ for some real number M.
If $f(x)$ is arbitrarily close to L by taking x sufficiently large,
$$\lim_{x \to \infty} f(x) = L$$

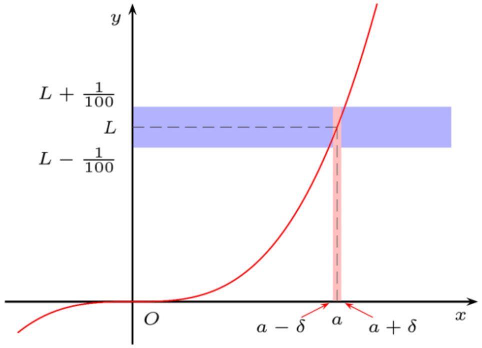
squeeze theorem

- Suppose $f(x)$ is bounded by $g(x)$ and $h(x)$ where
  - $g(x) \le f(x) \le h(x)$ for all x near a (except at a),
  - and $\lim_{x \to a} g(x) = \lim_{x \to a} h(x) = L$.

Then $\lim_{x \to a} f(x) = L$

definition of limits

Let f be a function defined on an open interval containing a, except possibly at a.
The limit of $f(x)$ as x approaches a, equals L if. for every $\epsilon > 0$ there is $\delta > 0$ such that
$$0 < |x - a| < \delta \Rightarrow |f(x) - L| < \epsilon$$



informally,

- $0 < |x - a| < \delta \Rightarrow x$ is close to but not equal to a.
- $0 < |f(x) - L| < \epsilon \Rightarrow f(x)$ is arbitrarily close to L.

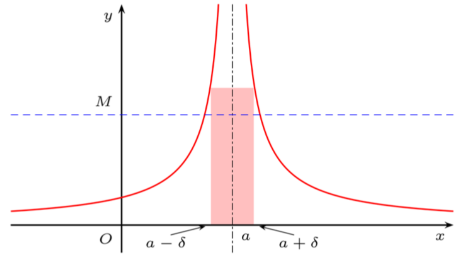
definition of one-sided limits

LH Limit: $\lim_{x \to a^-} f(x) = L$
if for every $\epsilon > 0$ there exists $\delta > 0$ such that
$$0 < a - x < \delta \Rightarrow |f(x) - L| < \epsilon$$

RH Limit: $\lim_{x \to a^+} f(x) = L$
if for every $\epsilon > 0$ there exists $\delta > 0$ such that
$$0 < x - a < \delta \Rightarrow |f(x) - L| < \epsilon$$

definition of infinite limit

$$\lim_{x \to a} f(x) = \infty$$
if for every $M > 0$ there exists $\delta > 0$ such that
$$0 < |x - a| < \delta \Rightarrow f(x) > M$$



negative infinite limit:
$$0 < |x - a| < \delta \Rightarrow f(x) < M$$

02. CONTINUOUS FUNCTIONS

definition of continuity

a function f is **continuous at** $a \Leftrightarrow$
f is continuous from the left and from the right at a.
$$\lim_{x \to a} f(x) = f(a)$$

a function f is *continuous at an interval* if it is continuous at every number in the interval.

f is continuous on **open interval** (a, b)
$\Leftrightarrow$ f is continuous at every $x \in (a, b)$

f is continuous on **closed interval** [a, b]

$$\Leftrightarrow \begin{cases} f \text{ is continuous at every } x \in (a,b) \\ f \text{ is continuous from the right at } a \\ f \text{ is continuous from the left at } b \end{cases}$$

continuity test

f is continuous at a $\Leftrightarrow$

1. f is defined at a (a is in the domain of f)
2. $\lim_{x \to a} f(x)$ exists
3. $\lim_{x \to a} f(x) = f(a)$

precise definition of continuity

a function f is continuous at a number a if $\forall \epsilon > 0, \exists \delta > 0$ such that $|x - a| < \delta \Rightarrow |f(x) - f(a)| < \epsilon$

examples of discontinuity

- removable discontinuity
- infinite discontinuity
- jump discontinuity

properties of continuous functions

let f and g be functions continuous at a. let c be a constant.

1. cf is continuous at a
2. $f + g$ is continuous at a
3. $f - g$ is continuous at a
4. fg is continuous at a
5. $\frac{f}{g}$ is continuous at a, provided $g(a) \neq 0$

other properties

- a polynomial is continuous everywhere;
- a rational function is continuous on its domain
- let c be a real number. $f(x) = c$ is continuous on $\mathbb{R}$.
- $f(x) = x$ is continuous on $\mathbb{R}$.

trigonometric functions

- $f(x) = \sin x$ and $g(x) = \cos x$ are continuous everywhere
- $\tan x, \sec x$ are continuous whenever $\cos x \neq 0$
- $\cot x, \csc x$ are continuous whenever $\sin x \neq 0$
  - domain: $\mathbb{R} \backslash \{0, \pm\pi, \pm 2\pi, \cdots\}$

composite of continuous functions

if f is continuous at b and $\lim_{x \to a} g(x) = b$, then

$$\lim_{x \to a} f(g(x)) = f(\lim_{x \to a} g(x))$$

if g is continuous at a and f is continuous at $g(a)$,
then $f \circ g$ is continuous at a.

$$\lim_{x \to a} (f \circ g)(x) = (f \circ g)(a)$$

substitution theorem

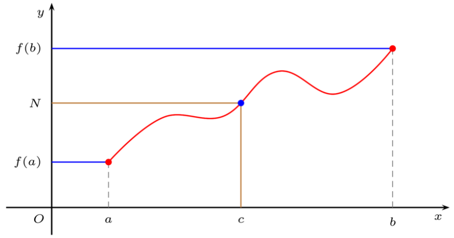
Suppose $y = f(x)$ such that $\lim_{x \to a} f(x) = b$. If

1. g is continuous at b, OR
2. $\forall x$ near a, except at a, $f(x) \neq b$ and $\lim_{y \to b} g(y)$ exists

Then $\lim_{x \to a} g(f(x)) = \lim_{y \to b} g(y)$

intermediate value theorem

Let f be a function continuous on $[a, b]$ with $f(a) \neq f(b)$.
Let N be a number between $f(a)$ and $f(b)$.
Then there exists $c \in (a, b)$ such that $f(c) = N$.



03. DERIVATIVES

tangent line

the **tangent line** to $y = f(x)$ at $(a, f(a))$ is the line passing through $(a, f(a))$ with slope $f'(a)$:

$$y = f'(a)(x - a) + f(a)$$

definition of derivatives

- f is differentiable at a if $f'(a)$ exists
- $f'(a)$ is the slope of $y = f(x)$ at $x = a$

$$f'(x) := \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

$$f'(a) := \lim_{x \to a} \frac{f(x) - f(a)}{x - a}$$

- $f'(x) = y' = \frac{dy}{dx} = \frac{df}{dx} = \frac{d}{dx} f(x) = D_x f(x) = \cdots$
- $\frac{dy}{dx} := \lim_{x \to 0} \frac{\Delta y}{\Delta x}$ (derivative of y with respect to x)
- $f'(a) = \frac{dy}{dx}|_{x=a}$

differentiable functions

- f is differentiable at a if $f'(a) := \lim_{x \to 0} \frac{f(a+h) - f(a)}{h}$ exists.
- f is differentiable on (a, b) if f is differentiable at every $c \in (a, b)$

differentiability & continuity

- if f is differentiable at a, then f is continuous at a.
  - differentiability $\Rightarrow$ continuity
- continuity $\not\Rightarrow$ differentiability

triangle inequality

$|a = b| \leq |a| + |b|$ for all $a, b \in \mathbb{R}$
